

## CRITICAL THINKING AND DECISION MAKING

### COURSE DESCRIPTION

Although most leaders recognize the importance of critical-thinking, decision-making, and problem-solving, few have been formally trained in these skills. To that end, this highly interactive course teaches leaders effective decision-making and problem-solving techniques from a systems perspective – as well as providing the skills, tools, and strategies for thinking critically in the workplace.

### COURSE OBJECTIVES

Upon completion of this program, participants will be able to:

- Understand the subtle, but important, differences between critical thinking, decision making, and problem solving;
- Distinguish between the three types of problems and then apply the three different approaches to solving each type;
- Leverage their decision-making style's strengths, while compensating for its associated weakness, as identified by the *Measuring Decision Style Survey*;
- Apply effective numerical decision-making techniques; and
- Engage in creative, systems-based approaches to decision making, problem solving, and strategic planning.
